Enterprise mobility management (EMM) is the set of people, processes and technology focused on managing mobile devices, wireless networks, and other mobile computing services in a business context. As more workers have bought smartphone and tablet computing devices and have sought support for using these devices in the workplace, EMM has become increasingly significant.

BYOD (Bring your own device) is a model of computing in which users bring their own devices to work. This model is becoming increasingly popular as it allows users to work from anywhere and on any device. BYOD can also help to reduce the cost of IT by allowing users to use their own devices instead of purchasing new ones. However, BYOD also poses security risks, as users may not have the same level of security on their own devices as they do on company devices. To mitigate these risks, organizations should implement a BYOD policy that outlines the rules and regulations for using personal devices on the company network. This policy should cover topics such as data protection, device security, and acceptable use. Organizations should also provide users with the necessary tools and training to ensure that their devices are secure and compliant with the company's security requirements. BYOD can be a beneficial model of computing, but it must be implemented carefully to ensure that it is secure and compliant with the company's security requirements.
