testing that the flow conditioner performs similarly at different flow rates, provided the flow is turbulent, so only one air flow rate was tested: 1000-cfm at ambient pressure and temperature. A uniform velocity inlet was imposed at the model inlet, which was placed 10 pipe diameters upstream of the first bend.

COMPUTATIONAL FLOW MODEL OF By Kimbal A. Hall, PE

Computational Flow Modeling for Chemical Reactor Engineering will show the reactor engineer how to define the specific roles of computational flow modeling, select appropriate tools, and apply these tools to link reactor hardware to reactor performance. Overall methodology is illustrated with numerous case studies.

Computational fluid dynamics (CFD) is a branch of fluid mechanics that uses numerical analysis and data structures to analyze and solve problems that involve fluid flows. Computers are used to perform the calculations required to simulate the free-stream flow of the fluid, and the interaction of the fluid (liquids and gases) with surfaces defined by boundary conditions.
