This is an introduction to stochastic calculus. I will assume that the reader has had a post-calculus course in probability or statistics. For much of these notes this is all that is needed, but to have a deep understanding of the subject, one needs to know measure theory and probability from that per-spective.

Stochastic Calculus: An Introduction with Applications

This set of lecture notes was used for Statistics 441: Stochastic Calculus with Applications to Finance at the University of Regina in the winter semester of 2009. It was the first time that the course was ever offered, and so part of the challenge was deciding what exactly needed to be covered.

Lectures on Stochastic Calculus with Applications to Finance

the third part of this course, we develop the theory of stochastic differential equations and diffusions. We use this theory to show that many simple stochastic discrete models can be effectively studied by taking a diffusion approximation. Stochastic calculus has very important application in sciences (biology or physics) as well as mathematical ...

continuous-time models. With this third motivation in mind, we develop notation for the binomial model which is a bit different from that normally found in practice.

Recall that a stochastic process is a probability distribution over a set of paths. A change of measure of a stochastic process is a method of shifting the probability distribution into another probability distribution. In this section, we fix a final time T and suppose that all paths are defined over the time $0 \leq t \leq T$.

The following notes aim to provide a very informal introduction to Stochastic Calculus, and especially to the Itô integral and some of its applications. They owe a great deal to Dan ... Consider a non-continuous stochastic process X_t . From the definition of a stochastic process for each t that $X_t \in \mathbb{R}$. Now define $Y_t = \sup_{s \in [0;t]} X_s$.
