Gas separation concept. The operation of membrane systems is based on the principle of differential velocity with which various gas mixture components permeate membrane substance. The driving force in the gas separation process is the difference in partial pressures on different membrane sides.

A proton exchange membrane fuel cell transforms the chemical energy liberated during the electrochemical reaction of hydrogen and oxygen to electrical energy, as opposed to the direct combustion of hydrogen and oxygen gases to produce thermal energy.. A stream of hydrogen is delivered to the anode side of the MEA. At the anode side it is catalytically split into protons and electrons.

Bioresource Technology publishes original articles, review articles, case studies and short communications on the fundamentals, applications and management of bioresource technology.. The journal's aim is to advance and disseminate knowledge in all the related areas of biomass, biological waste treatment, bioenergy, biotransformations and bioresource systems analysis, and technologies ...

3.1. Post-combustion. This process removes CO<sub>2</sub> from the flue gas after combustion has taken place. Post-combustion technologies are the preferred option for retrofitting existing power plants. The technology has been proven at small-scale with CO<sub>2</sub> recovered at rates up to 800 t/day. However, the major challenge for post-combustion CO<sub>2</sub> capture is its large parasitic load.
