Many different types of structures and components of structures can be built using reinforced concrete including slabs, walls, beams, columns, foundations, frames and more.. Reinforced concrete can be classified as precast or cast-in-place concrete.. Designing and implementing the most efficient floor system is key to creating optimal building structures.

Design and Construction of Lifting Beams DAVID T. RICKER Lifting beams (also known as spreader beams) are used to underside for attachment to the object to be hoisted, thus assist in the hoisting process.

In continuum mechanics, stress is a physical quantity that expresses the internal forces that neighbouring particles of a continuous material exert on each other, while strain is the measure of the deformation of the material. For example, when a solid vertical bar is supporting an overhead weight, each particle in the bar pushes on the particles immediately below it.

1. Introduction. The engineering properties of materials and structural components, notably fatigue life, distortion, dimensional stability, corrosion resistance, and brittle fracture can be considerably influenced by residual stresses .Such effects usually bring to considerable expenditure in repairs and restoration of parts, equipment, and structures.

Face plates from STOLLE Individually-produced stress-free face plates. STOLLE face plates are produced in a process which excludes inherent stresses and delivers high strength and stability.
